Application No.

Continuation of 5. does NOT place the application in condition for allowance because: Applicant argues that the formation of both functional capacitors in the cell area and pseudo capacitors in the peripheral region does not anticipate his claim language which includes forming a capacitor. This is not persuasive on two grounds 1) it is implicit in the reference that more than one capacitor is formed in the cell array region where the capacitors formed are functional 2) claim language is given its broadest reasonable interpretation and therefore the term "capacitor" used by the Applicant is broad enough to include pseudo capacitors, in either case, layer 16 is patterned to provide a lower electrode for the multiple capacitors in both the cell array and peripheral areas and fully anticipates Applicant's claimed steps. Applicant further argues that claim 3 is not anticipated because Takada fails to teach a first and second resistance element as recited in the claims- Applicant is referred to Col.9, lines: 65-67, teaching a "first resistance element electrode" and a "second resistance element electrode" which fully anticipates Applicant's claim language of a "first resistance element and second resistance element might not be the same structure referred to in Applicant's specification, limitations from the specification are not read into the claim language. Applicant also argues that the cell plate and second capacitor electrode are not formed simultaneously with the first and second resistance elements - however upon review of Col.9, lines: 60-67 and review of the figures, Applicant should see that all of these are infact formed simultaneously and the patterning of this layer also further supports the rejection of claim 19.
